

ATTACHMENT A
Amendments to the Specification

At the following locations, a marked up copy of the replaced paragraph is provided.

Page 1, paragraph no. [0003]:

Subcl B1 [0003] One known conventional dispensing container has a torodial-shaped body. To open this package, pressure applied to the pack opens a small lid, allowing mints to be tipped out, with a flip top lid. The lid has a depressable, actuator portion and tab portion. ~~The lid covers nearly the entire top surface of the container while each portion covers approximately one half thereof. Upon depressing the actuator portion, the tab portion flips upward to its opened position, thereby exposing a small opening in the top surface of the container located at a mid point of the top surface which is covered by the tab portion.~~
